### The Real Number System 1

### 1.1 Number Systems

Natural :  $\mathbb{N} = \{1, 2, 3, ...\}$ Integer:  $\mathbb{Z} = \{-2, -1, 0, 1, 2, ...\}$ Rational :  $\mathbb{Q} = \frac{p}{q}$  where  $p,q \in \mathbb{N}$ 

\*\*\* Q is countable, but fails to have the least upper bound property \*\*\*

# Example 1.1.1

Let  $\alpha \in \mathbb{R}$  where  $\alpha^2 = 2$ . Then  $\alpha$  cannot be rational.

# <u>Proof</u>

Let  $\alpha = \frac{p}{q}$  where p and q cannot both be even. Let set  $A = \{x \in \mathbb{Q} \text{ for } x^2 < 2\}$  where  $A \neq \emptyset$  and 2 is an upper bound for A. A has no least upper bound in Q, but A has a least upper bound in R.

### 1.2Real Number System

 $\mathbb{R}$  is the unique ordered field with the least upper bound property.  $\mathbb{R}$  exists and unique.

## Definition 1.2.1

Let S be a set. An order on S is a relation < satisfying two axioms:

• Trichotomy: For all  $x,y \in S$ , only one holds true:

-x < y-x = y

-x > y

• Transitivity: If x < y and y < z, then x < z.

# Definition 1.2.2

An ordered set is a set with an order.

# Definition 1.2.3

Let S be an ordered set. Let  $E \subset S$ .

An upper bound of E is a  $\beta \in S$  if  $x \leq \beta$  for all  $x \in E$ .

If such a  $\beta$  exists, then E is bounded from above.

# Definition 1.2.4

Let S be an ordered set. Let  $E \subset S$  be bounded from above.

Then, there exists a least upper bound  $\alpha$  if:

- $\alpha$  is an upper bound for E
- If  $\gamma < \alpha$ , then  $\gamma$  is not an upper bound for E.

Then  $\alpha = \sup(E)$ .

\*\*\* Greatest Lower Bound: inf(E) \*\*\*

# Example 1.2.5

Let  $S = (1, 2) \cup [3, 4) \cup (5, 6)$  with the order < from  $\mathbb{R}$ . For subsets E of S:

- E = (1,2) is bounded above and  $\sup(E) = 3$
- E = (5,6) is not bounded above so  $\sup(E) = DNE$
- E = [3,4) is bounded below inf(E) = 3 and sup(E) = DNE

# Observations on the Least Upper Bound

If sup E exists, it may or may not exists at E.

If  $\alpha$  exists, then  $\alpha$  is unique. If  $\gamma \neq \alpha$ , then  $\gamma < \alpha$  or  $\gamma > \alpha$ .

# 1.3 Least Upper Bound Property

# Theorem 1.3.1

An ordered set of S has a least upper bound property if:

For every nonempty subset  $E \subset S$  that is bounded from above:  $\sup(E)$  exists in S.

### Example 1.3.2

 $\mathbb{Q}$  doesn't have a least upper bound property. For example,  $z = \sqrt{2}$ .

### Proo

Let 
$$z = y - \frac{y^2 - 2}{y + 2} = \frac{2y + 2}{y + 2}$$
, then take  $z^2 - 2 = \frac{2(y^2 - 2)}{(y + 2)^2}$ .  
Let set  $A = \{y > 0 \in \mathbb{Q} \text{ where } y^2 < 2\}$  and set  $B = \{y > 0 \in \mathbb{Q} \text{ where } y^2 > 2\}$ 

- If  $y^2 2 < 0$ , then y is not an upper bound for E.
- If  $y^2 2 > 0$ , y is an upper bound for E, but not the sup(E).

Thus, E has no least upper bound in  $\mathbb{Q}$ .

However in  $\mathbb{R}$ ,  $\sqrt{2}$  is in E.

# 2 Day 2: Fields

# 2.1 Greatest Upper Bound Property

Theorem 2.1.1: Least Upper Bound implies Greatest Upper Bound

Let S be a ordered set with the least upper bound property.

Let non-empty  $B \subset S$  be bounded below.

Let L be the set of all lower bounds of B.

Then  $\alpha = \sup(L)$  exists in S and  $\alpha \in B$ .

## Proof

L is non-empty since B is bounded from below.

Thus, by the least upper bound property of S,  $\alpha = \sup(L)$  exists in S. We claim that  $\alpha = \inf(B)$ .

If  $\gamma < \alpha$ , then  $\gamma$  is not an upper bound for L so  $y \notin B$ .

Thus, for every  $x \in B$ ,  $\alpha \le x$ .

If  $\gamma \geq \alpha$ , then  $\gamma$  is an upper bound of L so  $\gamma \in B$ . Thus,  $\inf(B) = \alpha$ .

# 2.2 Fields

Addition Axioms

- If  $x,y \in F$ , then  $x+y \in F$
- x+y = y+x for all  $x,y \in F$
- (x+y)+z = x+(y+z) for all  $x,y,z \in F$
- There exists  $0 \in F$  such that 0+x = x for all  $x \in F$
- For every  $x \in F$ , there is  $-x \in F$  where x+(-x)=0

Multiplicative xioms

- If  $x,y \in F$ , then  $xy \in F$
- yx = xy for all  $x,y \in F$
- (xy)z = x(yx) for all  $x,y,z \in F$
- There exists  $1 \neq 0 \in F$  such that 1x = x for all  $x \in F$
- If  $x \neq 0 \in F$ , there is  $\frac{1}{x} \in F$  where  $x(\frac{1}{x}) = 1$

Distributive Law

x(y+z) = xy + xz hold for all  $x,y,z \in F$ .

### Definition 2.2.1

(a) If x+y = x+z, then y = z

<u>Proof</u>

$$y = 0+y = (-x)+x+y = (-x)+x+z = 0+z = z$$

2.2

Fields

From (a), let z = 0.

(c) If x+y = 0, then y = -x  $\frac{\text{Proof}}{\text{From (a), let } z = -x}.$ 

(d) -(-x) = x  $\frac{\text{Proof}}{\text{From (c), let } x = -x \text{ and } y = x.}$ 

(e) If  $x \neq 0$  and xy = xz, then y = z  $\frac{\text{Proof}}{y = 1y = \frac{1}{x}xy = \frac{1}{x}xz = 1z = z}$ 

(f) If  $x \neq 0$  and xy = x, then y = 1  $\frac{\text{Proof}}{\text{From (e), let } z = 1.}$ 

- (g) If  $x \neq 0$  and xy = 1, then  $y = \frac{1}{x}$ Proof

  From (e), let  $z = \frac{1}{x}$ .
- (h) If  $x \neq 0$ , then  $\frac{1}{1/x} = x$   $\frac{\text{Proof}}{\text{From (g), let } x = \frac{1}{x} \text{ and } y = x.}$
- (i) 0x = 0  $\underline{\text{Proof}}$ Since 0x + 0x = (0+0)x = 0x, then 0x = 0.
- (j) If  $x,y \neq 0$ , then  $xy \neq 0$   $\frac{\text{Proof}}{\text{Suppose } xy = 0, \text{ then } \frac{1}{y}\frac{1}{x}xy = \frac{1}{y}1y = \frac{1}{y}y = 1.}$  xy = 0 = 1 is a contradiction.
- (k) (-x)y = -(xy) = x(-y)Proof xy + (-x)y = (x+(-x))y = 0y = 0.Then by part (c), (-x)y = -(xy).

  Similarly, xy + x(-y) = x(y+(-y)) = x0 = 0.Then by part (c), x(-y) = -(xy).

(l) 
$$(-x)(-y) = xy$$

# **Proof**

By part (k), then 
$$(-x)(-y) = -[x(-y)] = -[-(xy)]$$
.

By part (d), 
$$-[-(xy)] = xy$$
.

# 2.3 Ordered Fields

An ordered field F is a field F which is also an ordered set for all  $x,y,z \in F$ .

- If y < z, then y+x < z+x
- If x,y > 0, then xy > 0

# Definition 2.3.1: $\mathbb Q$ and $\mathbb R$ are ordered fields

 $\mathbb{Q}$ ,  $\mathbb{R}$  are ordered fields, but  $\mathbb{C}$  is not an ordered field.

## Definition 2.3.2

Let F be an ordered field. For all  $x,y,z \in F$ .

- If x > 0, -x < 0 and vice versa
- If x > 0 and y < z, then xy < xz
- If x < 0 and y < z, then xy > xz
- If  $x \neq 0, x^2 > 0$
- If 0 < x < y, then 0 < 1/y < 1/x

# Theorem 2.3.3: R is a ordered field with <

There exists a unique ordered field  $\mathbb{R}$  with the least upper bound property. Also,  $\mathbb{Q} \subset \mathbb{R}$ .

# Theorem 2.3.4

For all  $x,y \in \mathbb{R}$ :

• Archimedean Property: If x > 0, there is  $n \in \mathbb{Z}$  such that nx > y.

# Proof

Fix x > 0. Suppose there is a y such that the property fails.

Let 
$$A = \{ nx: n = 1, 2, 3, ... \}.$$

Then, A is nonempty and bounded from above by y.

Then by the least upper bound property by  $\mathbb{R}$ ,  $\alpha = \sup(A)$  exists in  $\mathbb{R}$ .

Since x > 0, then -x < 0 so  $\alpha - x < \alpha - 0 = \alpha$ .

So  $\alpha - x$  is not an upper bound of A.

So there is a  $mx \in A$  such that  $mx > \alpha - x$ 

But then  $\alpha < (m+1)x$  where  $(m+1)x \in A$  which contradicts  $\alpha$  is an upper bound for A.

•  $\mathbb{Q}$  is dense in  $\mathbb{R}$ : If x < y, there is a  $p \in \mathbb{Q}$  such that x .

# <u>Proof</u>

Since x < y, then y-x > 0. Then by the Archimedean Property, there exists a  $n \in Z$  such that n(y-x) > 1. Thus, ny > nx+1 > nx

By the well-ordering principle, there is a smallest  $m \in \mathbb{Z}_+$  such that m > nx.

Then,  $m > nx \ge m-1$  so  $nx+1 \ge m > nx$ .

Since  $ny > nx+1 \ge m > ny$ , then y > m/n > x.
